

Prototypes

Low Fidelity

I chose to have my items in the cart to be displayed in order on the cart page with details briefly displayed. Users can perform several tasks from the page as well (Ex: Back to Details Page, Delete, Add to Wishlist etc.). Also I chose to have a summary box by the side to calculate the total amount of money that users are expected to pay, along with taxes and delivery fees. The updated change on my sketch is that I moved the order summary from bottom to the side because I thought it would be easier to implement functions later to display all items in cart.

High Fidelity

Based on my idea, I changed my high fidelity prototype accordingly and moved the order summary box to the side.

A high-fidelity prototype of a shopping cart page for "Fluff Stuff". The page has a header with a logo, "Home", "Product", "About Us", "FAQ", and "My Account" links. The main content area is divided into two sections: "Shopping Cart" on the left and "Order Summary" on the right. The "Shopping Cart" section lists a "Couch Pillow" item with a price of \$20.00, a quantity dropdown set to 1, and links for "Edit" and "Back to Details". The "Order Summary" section displays the same information as the hand-drawn sketch, including Subtotal (\$20.00), Shipping (TBD), Estimated Tax (\$0.00), and Total (\$20.00). It also includes a "Proceed To Checkout" button and a "Promo Code" input field.
